

Computer Virus

computer virus

- ❑ A computer virus is a type of computer program that, when executed, replicates itself by modifying other computer programs and inserting its own code. If this replication succeeds, the affected areas are then said to be "infected" with a computer virus, a metaphor derived from biological viruses.

How viruses work

- ❑ Computer viruses generally require a host program.
 - ❑ The virus writes its own code into the host program. When the program runs, the written virus program is executed first, causing infection and damage.

Types of Viruses

- ⌘ **Common types are:**
- ⌘ **Viruses:** A virus is a small piece of software that piggy backs on real programs.
- ⌘ **E-mail viruses:** An e-mail virus travels as an attachment to e-mail messages, and usually replicates itself by automatically mailing itself to dozens of people in the victim's e-mail address book.

Types of Viruses

- ❑ **Worms:** A worm is a small piece of software that uses computer networks and security holes to replicate itself.
- ❑ A computer worm does not need a host program, as it is an independent program or code chunk.
- ❑ can run independently and actively carry out attacks.

Types of Viruses

Trojan horses: A Trojan horse is simply a computer program. The program claims to do one thing (it may claim to be a game) but instead does damage when you run it (it may erase your hard disk). Trojan horses have no way to replicate automatically.

Virus symptoms

virus sources

- ❑ Unknown source software
- ❑ Downloading unauthorized software from the Internet.
- ❑ e-mail
- ❑ Using infected devices and storing disk files through them.

Prevention and treatment of the virus

- ❑ Antivirus software
- ❑ For the effectiveness of anti-virus software, the list of viruses in the program must be updated.
- ❑ Do not open attachments in any email you do not know was sent
- ❑ Do not accept any file from someone you do not know
- ❑ Examine all programs downloaded from the Internet
